iButton Temperature Data from 40 Aquatic Vegetation Plots in Prudhoe Bay, Alaska

Emily Watson-Cook, Jana Peirce

19 February 2022

Thermocron iButton data loggers were installed on July 19, 2021, in 30 thaw ponds in the NIRPO and Jorgenson Field Sites, Prudhoe Bay, Alaska, and programmed to record temperature in degrees Celsius every hour. They were retrieved on August 23, 2021.

Sensors were installed in the following locations in each pond:

- Water surface
- Above the moss layer
- At the sediment surface.

Two additional sensors were installed to record air temperature at each site (NIRPO and Jorgenson), and one sensor was installed at the water surface in a lake at the Jorgenson site.

Raw Data (99,720 rows)

Date	Time	iBtn ID	Temp (°C)	Plot ID	Plot_type	Community	Sensor Type
2021-07-19	6:00:00 PM	1	20.5	21A-01	Moss	CALRIC	Water surface
2021-07-19	6:00:00 PM	2	20.5	21A-01	Moss	CALRIC	Above veg
2021-07-19	6:00:00 PM	4	13.0	21A-01	Moss	CALRIC	Sediment
2021-07-19	6:00:00 PM	5	21.5	21A-02	Moss	SCOSCO	Water surface
2021-07-19	6:00:00 PM	6	21.5	21A-02	Moss	SCOSCO	Above veg
2021-07-19	6:00:00 PM	9	8.5	21A-02	Moss	SCOSCO	Sediment

Average Daily Temperature calculated (4320 rows)

Date	iBtn ID	Plot ID	Sensor Type	Plot Type	Community	Avg Daily Temp (°C)
2021-07-19	1	21A-01	Water surface	Moss	CALRIC	20.1
2021-07-19	10	21A-03	Sediment	Forb	HIPVUL	8.8
2021-07-19	101	21A-20	Sediment	Lake	N/A	15.7
2021-07-19	103	21A-21	Water surface	Moss	PSETUR	20.5
2021-07-19	105	21A-21	Above veg	Moss	PSETUR	20.8
2021-07-19	108	21A-21	Sediment	Moss	PSETUR	7.2

Mean Temperature by Sensor Location
Sensor Type	Mean Temp (°C)
Above veg	10.3
Air	8.5
Sediment	7.6
Water surface	10.6

Mean Temperature by Aquatic Plot Type
Plot Type	Mean Temp (°C)
Forb	9.7
Moss	9.1
Sparse	10.0

Mean Temperature by Sensor Location and Plot Type
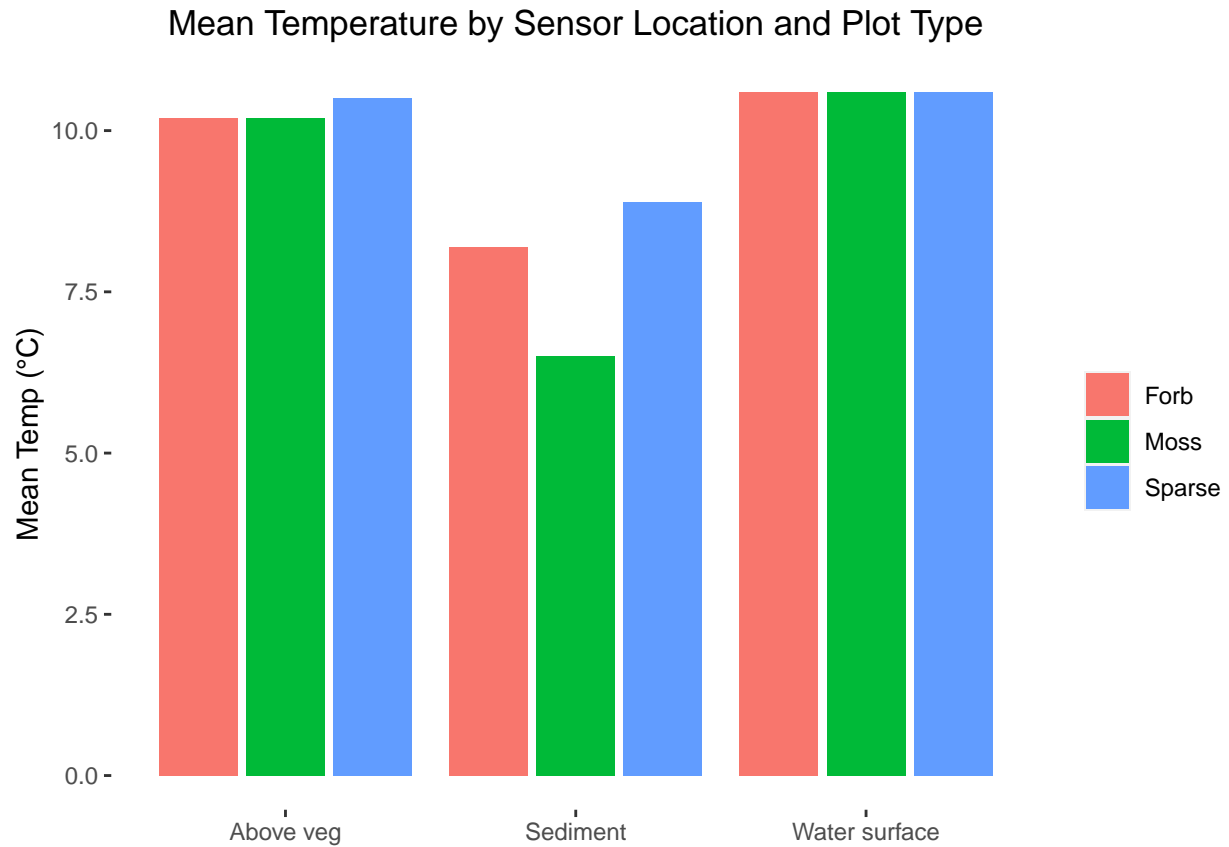

| Sensor Type	Plot Type	Mean Temp (°C)
Above veg	Forb	10.2
Above veg	Moss	10.2
Above veg	Sparse	10.5
Sediment	Forb	8.2
Sediment	Moss	6.5
Sediment	Sparse	8.9
Water surface	Forb	10.6
Water surface	Moss	10.6
Water surface	Sparse	10.6

Average Daily Temperature
Let's look at the data in more detail.

Here is a plot of the average daily temperature of each iButton from July 19 to August 23 from all sensor locations and all vegetation plot types.

Average Daily Temperature by Sensor Location
Now we can look at the same data but colored to indicated the location of the temperature sensor: At water surface, sediment surface, or below the water surface, but above the vegetation layer. Two sensors were also placed above the ground to record the ambient air temperature at each site.

Average Daily Temperature by Aquatic Plot Type
This time we'll look at the dominant type of aquatic vegetation in the 1-m plot. For example, here the plot shows the average daily temperature data for each sensor location (water surface, sediment surface, above moss layer) in thick moss plots as purple markers. Based onthe previous plot we can assume the coldest temperatures in thick moss plots come from the sensors at the sediment surface, and the warmest temperatures are from the water surface.
Average Daily Temperature by Sensor Location

**Let's look at some different facets of the data.**

First, we can focus on the average daily temperatures by sensor location. We see that the coolest temperatures are indeed at the sediment surface and the warmest at the water surface across all plot types.

Average Daily Temperature by Plot Type

Looking only at the average daily temperatures by aquatic vegetation plot type, we see that the coolest temperatures are in thick moss plots, but there is still a lot of variation, that is likely due to where the different sensors are positioned in the plot.
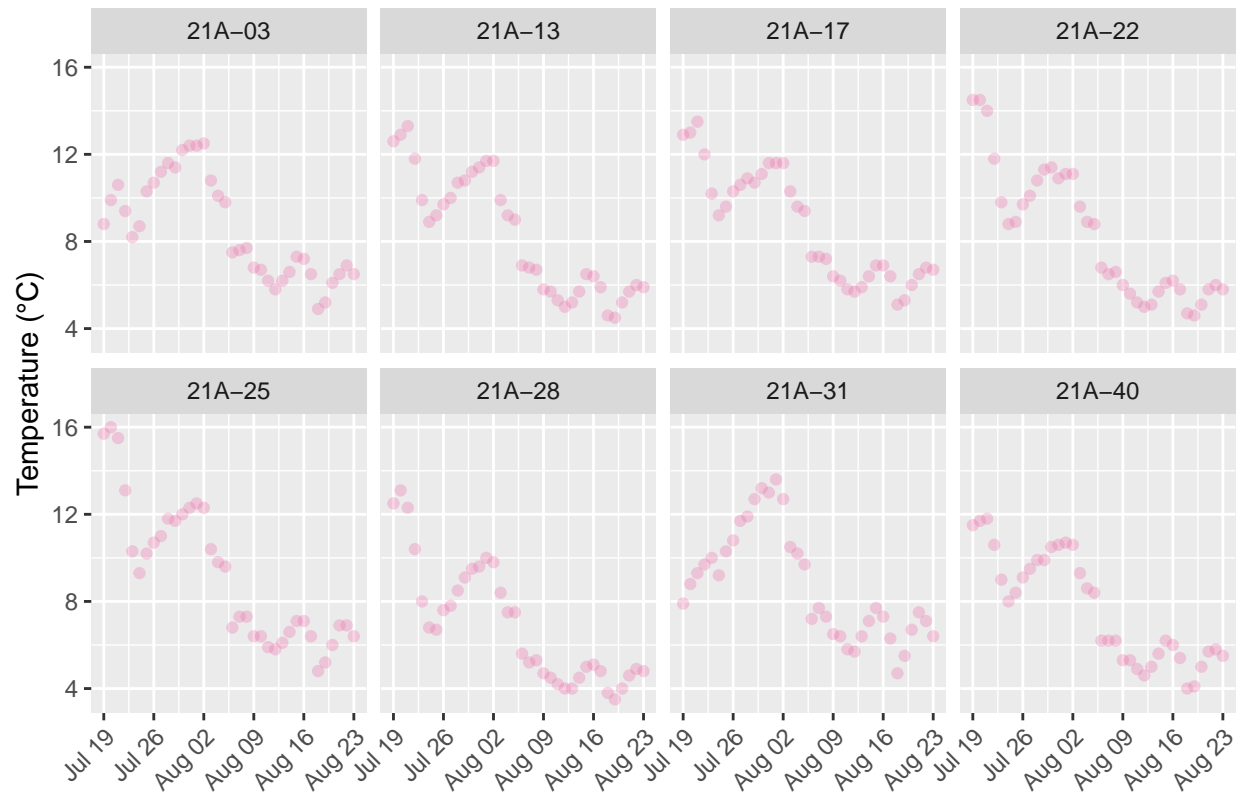

Avg. Daily Temp at Sediment Surface in Moss Plots
**How does aquatic vegetation type affect temperatures at the bottom of a pond?**

For more detail, we can look at the output of each sensor located at the pond bottom by the plot's vegetation type. To understand the variation in sediment surface temperature in thick moss plots, we would need to know more about the properties of each pond, such as its depth, age, water chemistry, the thickness of the vegetation mat, and the distane to ground ice beneath the pond. As we've seen, though, the coldest temperatures overall at pond bottoms are in plots where a layer of thick moss is present.

Avg. Daily Temp at Sediment Surface in Forb Plots

... and aquatic forbs.

Avg. Daily Temp at Sediment Surface in Sparse Plots
Finally, we observe the warmest temperatures at the pond bottom in "bare" plots - those without significant vegetation of any type.

That's it! (for now)
